Marked out of 1.0
Flag question
Which of the following statements are not true
Select one or more:
a. When a group by clause is available in a SQL query, fields in the group by clause must appear in the select clause
b. Having clause cannot be used without a group by clause
c. When a group by clause is available in a SQL query, fields in the select clause must be those in group by clause or an aggregate function
d. Where clause cannot contain aggregate functions
e. Having clause cannot contain aggregate functions

Practice Test
Consider the following description:
A university has two types of rooms namely lecture halls and laboratories. Lecture halls have a capacity and a number of resources such as whiteboard, podium and projector. Laboratory classes also have a capacity and number of resources. These are located in different buildings in the campus known by names such as 'Block A','Block B' and 'Block C'. Each building has a specific number of floors. Each room has a number unique to each building. There are batches taken to the universities. They are identified by the intake year and intake name (for ex: 2021 Regular intake). A batch may have several groups such as G1, G2, G3 & etc. Each group has number of students and group name is unique within each batch. During time tabling, a rooms are allocated for groups to conduct classes related to. The class name(such as 'lecture' and 'tutorial'), start time and the end time where the room will be ha should be recorded.
Which of the following are true related to the above :
Select one or more:
a. A group cannot exist without a batch
b. There are two identifying relationships in the diagram
c. The entity batch has a composite key
d. There are no descriptive attributes for relationships in the diagram
e. Allocated can be considered as a ternary relationship

Consider the following relation
Sales(productId,customerId,Qty,salesDate)
Which of the following query finds the id of the product from which at least 50 items are sold every time a sale is done.
Select one or more:
a. select productId from sales where qty>50
b. select s1.productId from Sales s1 where 50<= ALL(select qty from Sales s2 where s1.pid=s2.pid)
c. select productId from Sales group by productId having qty>50
d. select productId from Sales group by productId having Min(qty)>=50
e. select productId from Sales where 50<= ALL(select qty from Sales)

Practice Test
Consider the following requirements or a construction company:
Company have multiple construction sites. Each site has a unique site number, address and construction type such as('house', 'apartment', 'shopping complex'). For each site the company estimates the number the amounts required from each raw-mate and these values are stored(ex: cement packs, sand, & etc.). Raw-materials have three different types such as wall-construction materials, wiring materials, Roofing materials and timber materials. Each material is identified by a unique ID and has a unit of measurement such as liters and kilograms. There are many suppliers providing raw materials for construction companies. The suppliers have are identified by a unique supplier id and each supplier has a name, address and a phone number. These are tra by the construction company. However, during the construction company may purchase different amount of raw-materials for a site from different suppliers at different prices.
Which of the following are correct related to the EER diagram drawn for the above description.
Select one or more:
a. Raw material types could be represented by an attribute named type
b. Purchase relationship contains three descriptive attributes.
c. site is involved in a ternary relationship
d. Company is a strong entity in the EER
e. site is involved with a binary relationship with raw-material

Consider the following description:
A university has two types of rooms namely lecture halls and laboratories. Lecture halls have a capacity and a number of resources such as whiteboard, podium and projector. Laboratory classes also have a capacity and number of resources. These are located in different buildings in the campus known by names such as 'Block A','Block B' and 'Block C'. Each room has a number unique to each building. There are batches taken to the universities. They are identified by the intake year and intake name (for ex: 2021 Regular intake). A batch may have several groups such as G1, G2, G3 & etc. Each group has number of students and group name is unique within each batch. During time tabling, a rooms are allocated for groups to conduct classes related to. The class name(such as 'lecture' and 'tutorial'), start time and the end time where the room will be ha should be recorded.
Which of the following are true related to the above :
Select one or more:
a. Resources could be tracked using a multi-valued attribute
b. There are only strong entities in this description
c. The type of the rooms could be represented using sub classes
d. The type of the rooms could be represented as an attribute
e. If building is an entity room will be a weak entity

Consider the following description

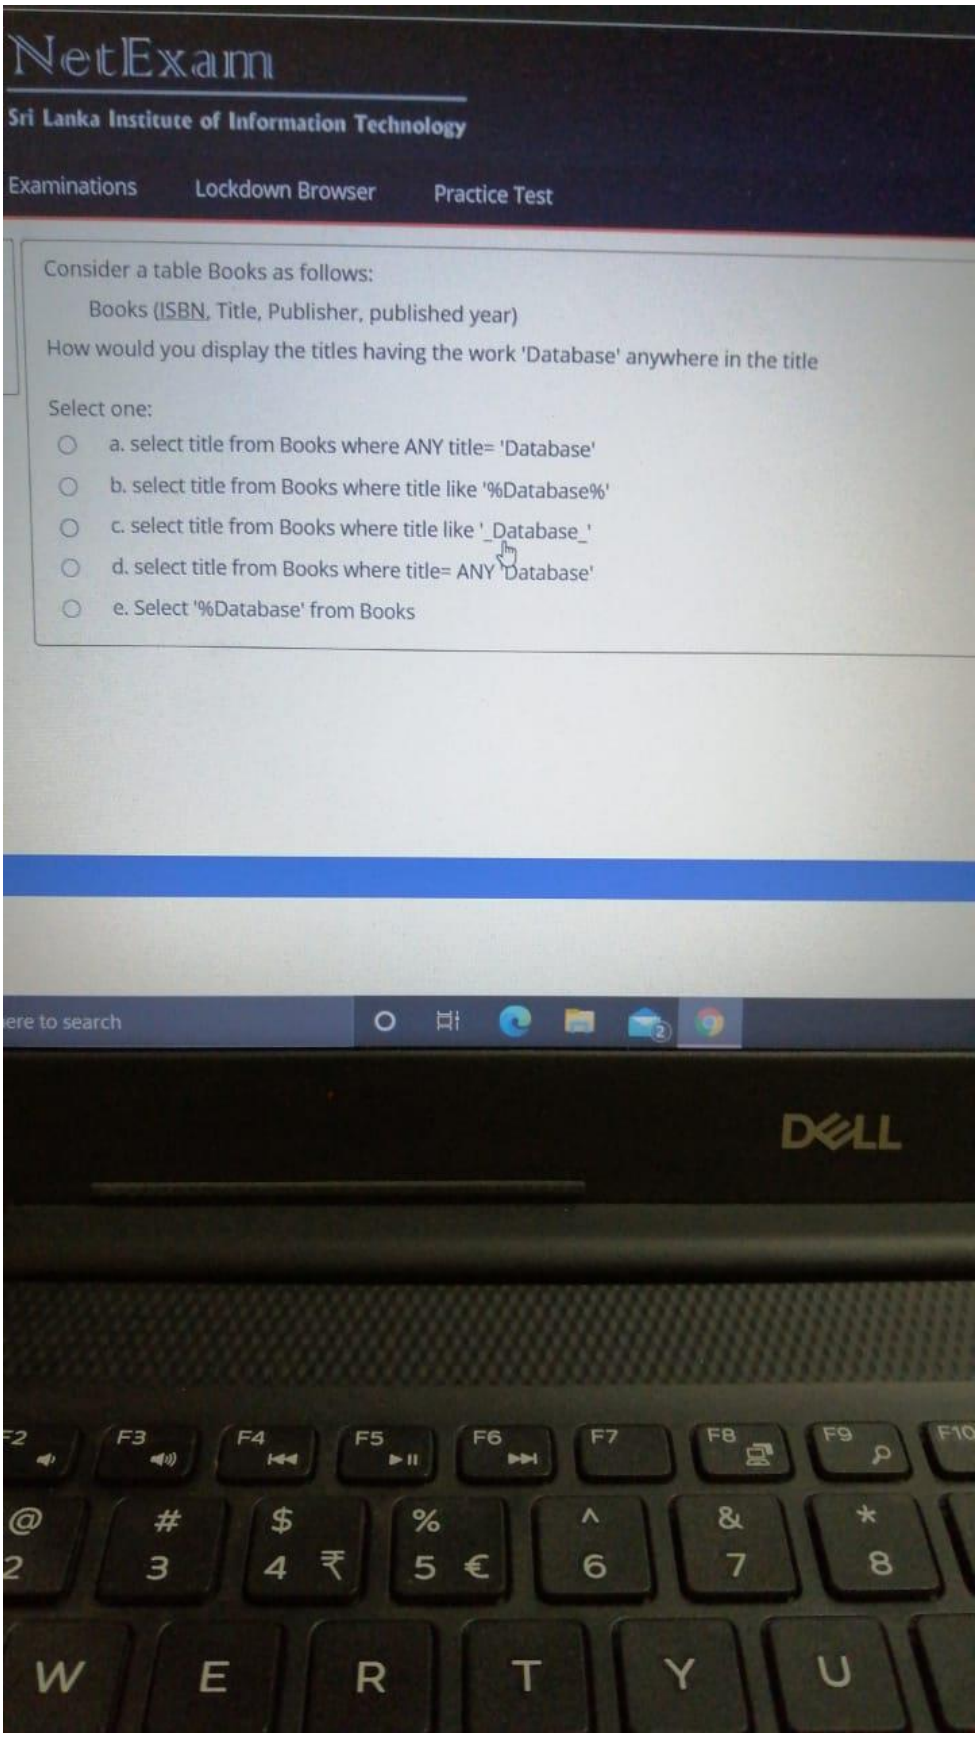

There are three kinds of doctors namely pediatricians, physicians and dermatologists. They are assigned with Unique IDs for identification. The system needs to store the first name, last name, age, phone number and their hospital information. Hospital information includes the name of the hospital, hospital type ('private','government') and location of the hospital. A doctor can work in several hospital in part time basis. Patients register in the system by providing their first name, last name, age and phone number and the system assign an ID for each patient. A doctor can diagnosis several diseases in patients. All diagnosis should be recorded with the date the diagnosis is made.

Which of the following statements are correct with respect to the above description.

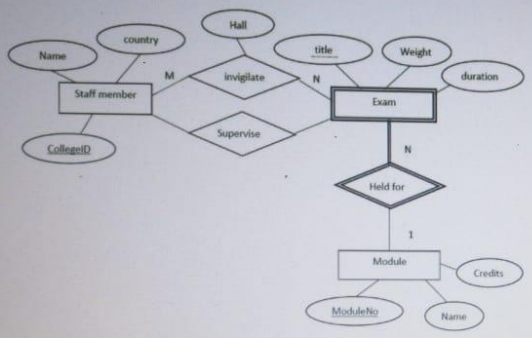

Select one or more:

- ☐ a. Doctor entity can have a type attribute to store their specialization such a 'dermatologist'
- ☐ b. Diagnosis is a descriptive attribute
- ☐ c. There are four main entities in the description
- ☐ d. It is possible to put doctor and patient under the same ISA hierarchy
- ☐ e. The EER diagram for the above scenario contains only binary relationships

Consider the following requirements or a construction company:
Company have multiple construction sites. Each site has a unique site number, address and construction type such as('house', 'apartment', 'shopping complex'). For each site the company estimates the number the amounts required from each raw-mater and these values are stored(ex: cement packs, sand, & etc.). Raw-materials have three different types such as wall-construction materials, wiring materials, Roofing materials and timber materials. Each material is identified by a unique ID and has a unit of measurement such as liters and kilograms. There are many suppliers providing raw materials for construction companies. The suppliers have are identified by a unique supplier id and each supplier has a name, address and a phone number. These are tra by the construction company. However, during the construction company may purchase different amount of raw-materials for site from different suppliers at different prices.
Which of the following are correct related to the EER diagram drawn for the above description.
Select one or more:
a. Company is a strong entity in the EER
b. site is involved with a binary relationship with raw-material
c. Raw material types could be represented by an attribute named type
d. site is involved in a ternary relationship
e. Purchase relationship contains three descriptive attributes.

Consider the following scenario:
A software company has been assigned with the responsibility of automating the tasks of a private bank. This include developing a database to record customer details, and an account details. Sunil, a senior DBA is assigned to the project to handle all the administrative tasks related to the databases by the database architect. Sunil creates the required databases and assigned Malika the responsibility of managing the bankDB. Malika assigns Keshan with the responsibility of creating tables. In addition, Keshan should be able to create views, stored procedures and triggers required. Asanka and Ferosh, who are data entry operators are given the responsibility of inserting the data to the table. Nihal is assigned with the responsibility of generating reports from the table in the data. For the above purpose, Nihal could directly query the data or call functions and procedures.
Which of the following/s should you need to provide the necessary permission to Asanka and Ferosh assuming that their usernames are asanka.n and Ferosh.a respectively
Select one or more:
a. ALTER ROLE dataEntry ADD MEMBER asanka.n
b. ALTER ROLE db_owner add member ferosh.a
c. GRANT INSERT on bankDB to dataEntry
d. ALTER ROLE dataEntry ADD MEMBER Ferosh.a
e. ALTER ROLE db_owner add member asanka.n

How can a DML statement (i.e. insert, delete, update) executed in the database?
Select one:
a. By making use of the execute() statement of the DMLStatement object
b. Using InsertStatement, DeleteStatement or UpdateStatement classes
c. By invoking Insert(), update() and delete() method on a statement object.
d. By invoking the executeInsert(), executeDelete() or executeUpdate() methods of the DMLStatement
e. By invoking the execute() or executeUpdate() method on a statement object

there are 4 options you can use to map this into an ER,
option 1
Person(SIN,Name)
Student(SIN,GPA)
Teacher(SIN,Salary)
option 2 Since this is a covering relationship, option 2 is not a good match.
Student(SIN,Name,GPA)
Teacher(SIN,Name,Salary)
option 3
Person(SIN,Name,GPA,Salary,Person_Type) person type can be student/teacher
option 4
Person(SIN,Name,GPA,Salary,Student,Teacher) Student and Teacher are bool type fields, it can be yes or no,a good option for overlapping
Since the sub classes don't have much attributes, option 3 and option 4 are better to map this into an ER

Consider the following relations of a database created for a Car Rental company.
Driver (driverID: char(4), driver_name: varchar(15), address: varchar(50), phone: char(10), licenceNo: char(5))
Car (carID: char(4), make: varchar(15), model: varchar(15), body_type: varchar(15), no_seats: int, year: datetime)
Route (route_id: char(4), source: varchar(20), destination: varchar(20), route_type: varchar(15), fare: real)
Customer (customerID: char(4), customer_name: varchar(20), phone: char(10), address: varchar(50))
Booking (booking_id: char(4), dateBooked: datetime, dateReturned: datetime, customerID: char(4), route_id: char(4), car_id: char(4), driverID: char(4))
The database stores information on Divers registered by the car rental company in the Driver table. The table stores a unique driver ID (driverID), name, address, phone number and the driving license number. Information about the Cars is recorded in the Car table. The table includes a unique number (carID), make ('Toyota', 'Honda', 'Audi', etc.), model ('Aqua', 'Civic' etc.), body type ('Wagon', 'Hatchback' etc.), number of seats, and the year manufactured. Route table stores all the operations on car routes including a unique number (route_id), route source, route destination, route type ('one way' or 'both ways') and the fare amount. Information about the Customers is also documented in the Customer table. The table consists of a unique number (customerID), customer name, phone number and address. When a Customer wants to rent a car the company stores the records in a Booking table along with the unique number (booking_id), date of which the booking happened, the return date of the car, the customer who elaborate in renting the car (customberID), the route in which the car is traveling (route_id), the car ID (car_id) and the driver who is dedicated for driving the car (driverID).
Create a trigger to update the noOfRoutes of a driver when adding a new record to the Booking table. Assume that there exists a stored procedure to update the total number of routes (noOfRoutes) of a driver based on the route entries recorded in the Booking table. The Driver table is modified by adding a new attribute (noOfRoutes: int).

Create a trigger to update the cost of a route when modifying a record to the Booking table. Assume that there exisits a stored procedure to check the approval of the new discount amount.
The company can grant a discount fare amount to customers for a given time period. The discount amount is assessed based on a condition. If the route type is 'two ways' a discount amount is 8% of the existing fare amount.
The request is directed for approval during the month of November.
